

# “Living Schematic” — SHIPPED (PoC) v0.91.0

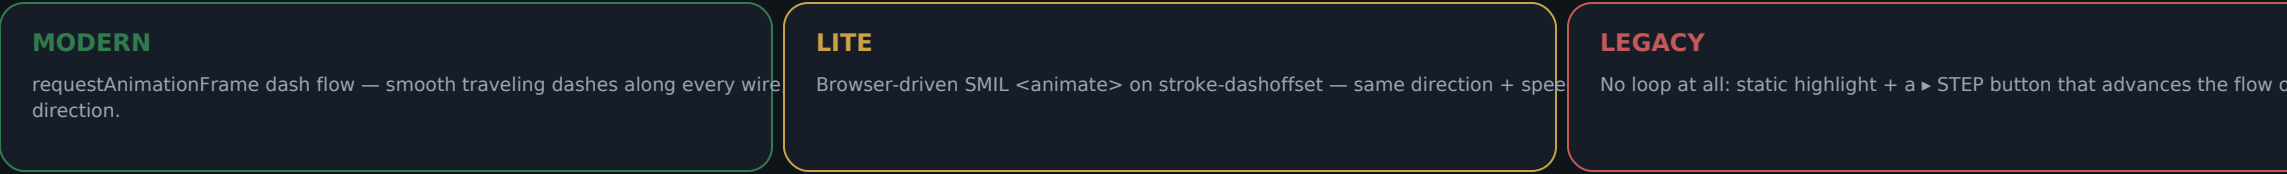

A flat vector schematic → an inferred netlist → an interactive overlay whose wires animate in the direction of flow.

## THE PIPELINE (per page, cached)

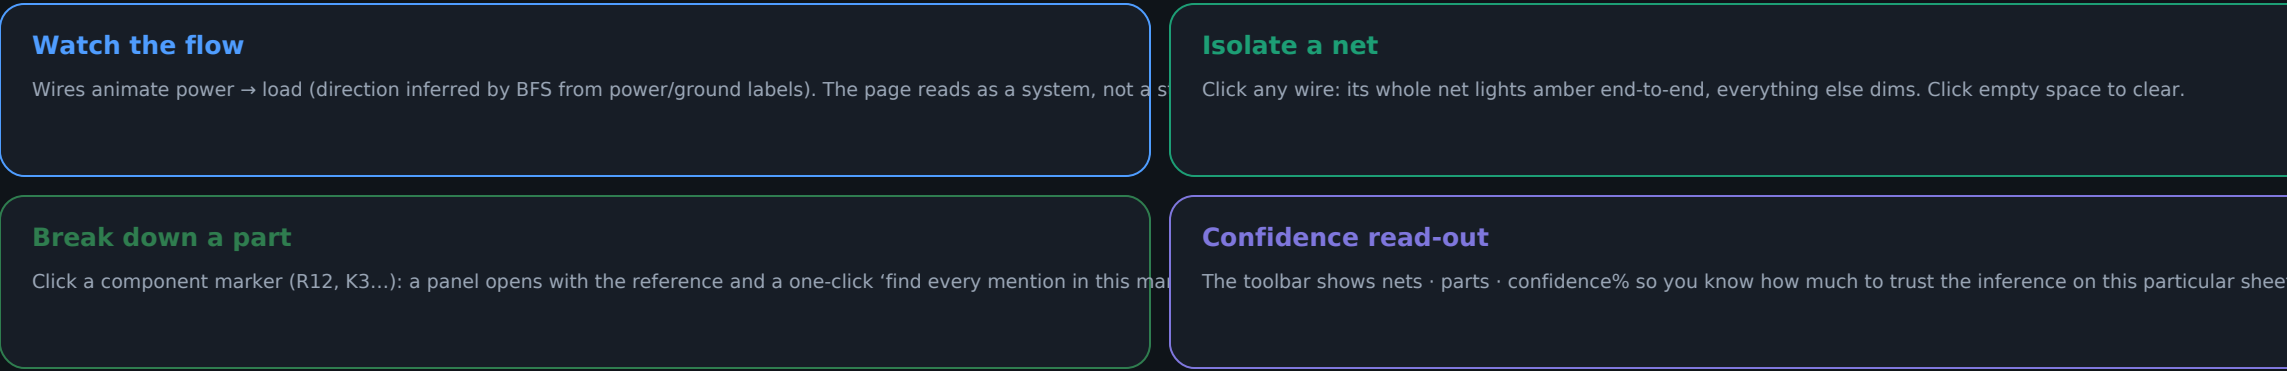

green = built on what already existed · amber = the new pieces.

## THE OVERLAY SCALES WITH THE BUILD (RPS)

## WHAT THE MECHANIC DOES

## VERIFIED ON THE REAL CORPUS

- Self-test: a synthetic loop + a mid-wire tap collapses to ONE connected net — the T-junction split works.
- Engine Wiring Harness p1 → 77 components · 1,652 wire-segments · 65 nets · confidence 0.97. Many wiring pages score ≥0.94.
- Visual proof (docs/schemflow\_proof.png): the inferred netlist traces the actual Caterpillar C7 engine schematic.
- Known PoC limit: CAD-exported sheets with OUTLINED label text yield wires/nets but no components — breakdown needs an OCR text layer.
