

Cross-reference engine — tiers & what gets matched (your call)

Decisively tie OCR-noisy parts to their vehicles and every breakdown/asset. Pick any mix.

X5 · Review & provenance

- Every repaired field keeps source + confidence (auditable, reversible). Unresolved → the Part# review queue.
- Bulk-confirm; your fixes always win.

Nothing silently wrong.

Confidence ladder

low (OCR only)

→ +FLIS name match

→ +PN→NSN confirmed

→ +vehicle applicability

→ +manufacturer/colloquial

→ = decided ✓ (else review)

What gets matched (your list)

TMs · models · parts · instructions/procedures · schematics · tags · pictures/photos/breakdown images · scans of all types — all keyed to NSN/part#/CAGEC and bound to their assorted vehicles and breakdowns. Built host-side into a sidecar xref.db (index never written, R1/R6); the app reads it instantly. Surfaced in the part card, dossier, 3-D, procedure, and a coverage report (how many parts fully resolved vs in review).
