

Local 3-D models — drop your CAD, replace the placeholder v0.94.0

If you have a real model file for a part, the 3-D tab loads IT instead of the representative geometry. Authoritative, not an approximation.

HOW IT WORKS

AUTHORITATIVE vs APPROXIMATION

VERIFIED (host-side)

- VERIFY-LOCALMODEL.bat: localmodel.py + viewer_app.py + both UI pages parse.

• Round-trip parse of a sample OBJ (8v/12f), ASCII STL and BINARY STL (36v/12f each) → all OK; test files cleaned up.

• gl3d auto-centres/auto-fits, so a model in any units displays correctly; materials still come from FLIS/scan.

• Additive & rollbackable (R1): drop the module + 2 routes + the loadLocalModel block. How-to: docs/LOCAL-MODELS.md.
