

Cross-reference everywhere — Ops + procedure + 3-D (v0.79.1)

The unified part record now surfaces across the app, and Ops shows how resolved the corpus is.

Ops coverage card

- Parsed rows · with NSN (%) · FLIS-validated (%) ·
- in-review (low-confidence %).
- From xref_coverage(); links to Part# review.
- See at a glance how much is decided vs needs a human.

Know where you stand.

3-D modal cross-reference

- Opened part's side panel now shows: FLIS name (OCR
- conflict noted), manufacturer (CAGEC→company),
- vehicles it fits, interchangeable / superseded,
- colloquial name, confidence + sources.

Full context where you look.

Procedure parts enriched

- Each part in a how-to now resolves inline to its
- name + the vehicles it fits (+ manufacturer).
- So a step's NSNs aren't just numbers — they're
- named, placed, and cross-referenced.

Parts in context, in the fix.

All from one source

Ops, the part card, the dossier, the 3-D modal, and the procedure page all read the same unified /api/part_record (FLIS-validated, provenance-tracked, offline). Run BUILD-RPSTL.bat (+ BUILD-XREF.bat for manufacturer/NSN recovery); the Ops card then shows your real coverage. Additive, ES5, index never written (R1/R6).
