

Post-restructure gap-fill v0.98.1

A paused 0.95 session re-synced to the real v0.98.0 tree, confirmed THE RESTRUCTURE kept the 0.90–0.95 stack intact, and closed two overlooked gaps.

1 · RE-SYNC & AUDIT (read-only) — did the monolith→features/ split drop anything?

- Routes: /cading /cadspin /cadstl /cadobj /api/cadmaterial /api/schempaths /api/schemgraph /api/localmodel(_mesh) — ALL registered in the new registry.
- Modules: schemgraph · localmodel · cad_render · schem_overlay — present + referenced by features/.
- cad_render CAD_VERSION 7 · render()/material_for/render_spin/ensure_spin intact · make_cad parallel (multiprocessing/--force) intact.
- UI: threed/schematics + cadview/schemflow/schemhl/gl3d served. → Nothing dropped by the split.

2 · GAPS FILLED (additive — no engine code touched)

tests/test_features_integration.py

16 checks spanning the imagery/CAD/
schematic features THROUGH the new
registry: routes registered, CAD v7,
material_for, render_spin, a v1 render,
schemgraph one-net, localmodel OBJ.
A permanent regression guard.

VERIFY-V098.bat

one host-side button: parse shell +
features/*.py, then run the core
suites + the new test to a log.

RESULT: 21+16+59+15+12 =
123 checks · 0 failures.

Refreshed hand-off docs

PROJECT-SUMMARY.md + PORTING.md
were stale (0.95 monolith).
Now describe the v0.98 thin shell
+ engine/features/ package,
registry/routes, new backups,
nav consolidation.

3 · SAFETY — why this couldn't collide with the restructure session

- The restructure (0.96→0.98, 2026-06-10) was already complete on disk — this session DISREGARDED redoing it (per instruction).
- This pass is purely ADDITIVE: two NEW files + doc/changelog edits. No feature module, route, or shell code was modified (R1).
- Rollback = delete the 2 new files + revert the doc/changelog entries. Everything verified green host-side (coherent files).
- R1 backwards-compatible · R4 changelog · R7 legacy parity entry · this diagram (R2/R3).
