

Living Schematic → production: review + Circuit Lab bridge v0.99.1

Three steps, now complete: (1) precompute netlists corpus-wide, (2) human review/override, (3) hand off to Circuit Lab.

STEP 1 · precompute

build_schemgraph.py (0.99.0)
-> index/schemcache + coverage TSV.
4,743 pages cached (verified).

STEP 2 · review / override

schemreview.py: append-only sidecar.
/api/schemgraph_review (queue) +
_decision (POST). schemflow ▶ Correct:
drop missed refs, mark good/bad.
r_schemgraph MERGES overrides.

STEP 3 · Circuit Lab bridge

✂ Circuit Lab shows the inferred
netlist (nets/comps/conf) + JSON
download; build the live circuit
over the page. (values not inferred)

THE REVIEW LOOP (closes the 0-components gap)

CAD-exported sheets outline their label text, so schemgraph finds wires but 0 components. The coverage TSV flags those pages; the review queue surfaces them; a reviewer drops the missing ref-designators (R12, K3...) which are then stored append-only and merged back into the served graph — so the Flow overlay and Circuit Lab bridge get the human-corrected netlist next time. (R1/R6: index never written.)

OBSERVABILITY + TESTS

/api/schemgraph_coverage

schematic pages · pages-with-components · avg confidence · nets total · pages reviewed.

test_features_modules.py

every features/ module imports; registry populated; new routes registered; schemreview round-trip.

test_features_integration.py

the 0.90-0.95 imagery/CAD/schematic stack still wired through the v0.98 registry (16 checks).

VERIFY-099.bat

one host-side button: syntax + UI JS + all suites -> docs/verify_099.log. (run after the USB copy)

STATUS

Built + logic-verified in-sandbox (schemreview queue/record/override/coverage; schemflow node --check; 4,743 pages cached). Full host suite pending VERIFY-099.bat (deferred: USB copy in progress). Additive & rollbackable (R1). Remaining backlog item: deep-zoom + callout hotspots (step 4).
