

Mission control: coverage · locator · doctor v0.99.6

Turn the enrichment batches into things you can SEE and USE — measure the corpus, jump to any part's figures, and health-check the whole system.

/coverage

coverage.py + /api/coverage.
One roll-up: OCR% · CAD% ·
vectorized% · schematic netlists ·
models · figure crops · sidecar
health. KPI bars + cards.
Verified vs a synthetic index.

/locate

partlocate.py + /api/partlocate.
'Where does this part show up?'
NSN/PN/name -> every figure &
page that calls it out, deduped,
with Deep-Zoom / Vector / open
links. Verified: 3 hits / 2 docs.

DOCTOR.bat

doctor.py: deps, CORPUS-PATH
reachability (the #1 migration
trap), coverage, cache counts,
disk free, recent errors ->
docs/doctor_report.txt.
Great before/after a move.

HOW IT TIES TOGETHER

The batches (OCR, CAD, schemgraph, vectorize) each write a sidecar + coverage file. /coverage reads them all into one picture. /locate reads the parts index to send you straight to a part's figures — which you then Deep-Zoom or Vectorize. DOCTOR checks the whole thing is healthy AND that the corpus is still reachable after a move. All read-only, sidecar-only (R1/R6).

VERIFIED / R1

- coverage.py / partlocate.py logic-tested in-sandbox on synthetic indexes (percentages + dedup correct).
- coverage.html + locate.html pass node --check (added to verify_ui.py); new modules added to VERIFY-099.bat.
- doctor.py parses; dep + corpus-path helpers verified. Route registrations pending the host suite (mount truncation).
- Additive & rollbackable: 3 modules + 3 pages + 4 read-only routes + DOCTOR.bat. Nothing writes the index.
