

Figure → Parts: closing the navigation loop v0.99.8

The locator sends you from a part to its figures. figureparts sends you from a figure back to ALL its parts — so you can walk the sheet both ways.

WHAT IT RETURNS

GET /api/figureparts?doc=ID&page=N -> { doc, page, fig_no, fig_title, count, parts:[{nsn, part_number, name, nomenclature, cagec, smr, uoc, dossier_url, locate_url, cad_url}] }. Deduped by (nsn, part-no, name); NSN-first ordering. Read-only on parts; db_path passed explicitly. The /deepzoom drawer consumes it directly and refreshes on page-turn.

VERIFIED / R1

- figureparts.py logic-tested in-sandbox on a synthetic index: dup part counted once, fig metadata extracted (fig FIG 5, count 2).
- deepzoom.html inline JS passes node --check; the □ drawer is pure ES5, no new deps. Route is one declarative @get (host-verify in VERIFY-099.bat).
- Additive & rollbackable: one module + one read-only route + one UI drawer. Nothing writes the index (R1/R6).
