

Job Card / Work Order — one bay-ready PDF for a TASK v0.99.9

Requirement C of the brief: a complete instructional rundown — how to remove/install, what tools, what torque — assembled from what's already in the index.

WHY IT MATTERS

Everything the app had — search, procedures, torque, the locator, figure rendering — was separate. The Job Card fuses them into the one artifact a mechanic actually carries into the bay: a single work order for 'replace the alternator' with the steps, the tools, the safety callouts, the torque, the parts and the figures, every line cited to the real TM page. This is the brief's requirement C.

VERIFIED / R1

- build_pdf() self-test produced a valid 4-page PDF from synthetic content (cover + text page + 2 figure pages); rendered & eyeballed (docs/jobcard_proof*.png).
- Auto page-break, WARNING/CAUTION in orange, torque in green, parts with NSN/P-N/CAGE/SMR — all correct. locate.html JS passes node --check.
- Route /api/jobcard gathers procedures+torque from the LIVE features (core.db injected) then calls the pure assembler. □ Work Order button on /locate.
- Additive & rollbackable: one module + one read-only route + one button. Nothing writes the index (R1/R6). Host-verify in VERIFY-099.bat.
