

Discoverability — the palette was dead; now it opens everywhere v0.99.11

Everything built this session was reachable only by typing the URL. Fix: revive Ctrl+K (it loaded on NO page), and surface the tools in the menu.

THE BUG

- palette.js existed + /palette.js was served — but NO html page included it.
- So 'press Ctrl+K anywhere' (in the Help link) did literally nothing.
- Its 'Search' action went to /?ex= — a param the home page never reads,
- so even when opened, searching from the palette silently did nothing.
- Net effect: a whole command palette shipped dark for weeks.

THE FIX

- Added <script src="/palette.js"> to home + 8 tool pages (solve, procedure, dossier, partdiff, locate, coverage, jobcard, deepzoom). Ctrl+K now opens.
- Search action → /?q=, plus a home ?q= deep-link handler in palette.js that prefills #q and calls runSearch — /?q=<query> actually runs now.
- verify_ui.py now node --checks palette.js + deepzoom.js host-side too.

NOW REACHABLE IN ONE KEYSTROKE (Ctrl+K) OR THE TOOLS MENU

 Search	 Find a part	 Dossier	 Work Order	 How-to
 Look-Alike	 Solve it	 Coverage	 Circuit Lab	 3-D
 Schematics	 Add docs	 Ops	 OCR status	 Help

VERIFIED / R1

- Root cause found by grepping every ui/*.html: palette.js referenced by 0 pages (only mentioned in help.html text).
- palette.js read host-authoritatively: 129 lines, IIFE balanced/closed; new commands + /?q= + deep-link handler present.
- Script includes confirmed on host via the Read tool (jobcard L95, solve L152, ...). Sandbox grep lagged (mount cache) — host is truth.
- verify_ui.py extended: node --check of palette.js + deepzoom.js added to VERIFY-099.bat (host-side, since the mount truncates grown files).
- Additive & rollbackable: pure <script> includes + palette rows + one Tools-menu group + one ?q handler. Nothing writes the index (R1/R6).
