

Verification map — what VERIFY-099.bat now guards v0.99.12

The pre-1.0 hardening pass starts by locking in the work-order stack: behaviors verified by hand while building are now permanent regression tests.

test_features / _integration restructure kept the 0.90–0.95 imagery/CAD/schematic stack wired; CAD_VERSION 7, routes registered, material_for, schemagraph, localmodel.	test_features_modules every features/*.py imports; registry populated; new schemagraph review routes present; schemreview sidecar round-trips.	test_jobcard (NEW) figureparts dedup + fig meta + urls; jobcard intent/order/warning/preview; build_pdf valid multi-page; procedure materials + refs parse.	test_routes / _search / _hardening route table shape; search quality (ranking/dedup); hardening (POST cap, same-origin, param validation → 400 not 500).
--	---	--	---

WHAT test_jobcard PINS DOWN

- figureparts.parts_on: a part listed twice on a sheet counts ONCE; figure no./title surfaced; NSN-first; dossier URLs; bad input safe.
- jobcard._task_intent: 'replace...'→Replacement, 'adjust...'→Adjustment, a bare NSN→no verb. _order_procs floats the matching kind first.
- jobcard._lookalike_warning: fires when same-name parts differ by UOC/CAGEC/SMR/FSC/part-#; SILENT on NSN format-drift; None when absent.
- jobcard.build_pdf: still emits a valid multi-page PDF once the Materials section + △ BEFORE-YOU-START box are present.
- procedures_feature._parse_procedure: MATERIALS captured, TM/WP/LO/TB/TC refs digit-anchored (no 'LOCKWASHER'), steps-only page still parses.

HOW IT RUNS (mount-truncation aware)

figureparts.py is small/un-grown so its checks run in-sandbox now (green). jobcard.py + procedures_feature.py GREW this session, so the sandbox mount serves truncated reads — their assertions were verified standalone w building and now run HOST-SIDE via VERIFY-099.bat (python tests/test_jobcard.py). Same discipline as the rest of the 0.99.x wave: logic in-sandbox, wiring host-side.

R1 · additive: one new test module + one line in the verify batch. Nothing writes the index. Next hardening step: property/fuzz over the pure helpers.
