

Feature audit + palette QoL v0.99.13

A self-check that catches the palette-was-dead class of bug forever, plus two quality-of-life wins that reach all 19 pages from one file.

audit_features.py — what it cross-checks (host-side)

- [1] every registered page + served script has a FILE (no 404 routes).
- [2] every served script is REFERENCED by some page/asset — the exact check that would have caught palette.js (served, included nowhere).
- [3] orphan pages: ui/*.html with no route (unreachable / oversight).
- [4] broken internal links: href/fetch → a route that doesn't exist.
- [5] every features/*.py + top-level module still imports.

RESULT on the real tree: 0 FAIL — 0 dead scripts, 0 orphans,
0 broken links, all modules import. Wired into VERIFY-099.bat +
AUDIT.bat -> docs/feature_audit.txt.

palette.js QoL (Ctrl+K, all 19 pages)

type a part / task...

RECENT

- Work Order — “alternator”
- Look-Alike Parts — “valve”
- Deep Zoom — p.214

⌘K jump

THE TWO QoL WINS

RECENT — every tool page you open is recorded (path + ?q + title) to localStorage; the palette shows your last few at the top when the box is empty, so you jump straight back to the part/figure you were on. ES5-safe with a URLSearchParams regex fallback. PILL — a subtle '⌘K jump' pill on every page finally makes the command palette discoverable, not just documented.

VERIFIED / R1

- audit logic run in-sandbox against the real ui/ folder: 0 dead scripts (handles ?v= cache-busters), 0 orphans, 0 broken links.
- audit_features.py parses (166 lines, tail sys.exit(main())); imports the live registry host-side to be authoritative.
- palette.js read host-authoritatively (161 lines, IIFE balanced/closed); the Recent + pill blocks pass node --check in isolation.
- One file (palette.js) delivers both QoL wins to all 19 pages — no per-page edits. Nothing writes the index (R1/R6).
