

All recommendations + the meld v0.99.15

Five recommendations shipped, then proven to fit together: every cross-link a feature emits resolves to a real route, and a fuzz-found crash was fixed.

#2 Fuzz render/vectorize

Extended fuzz to vectorize_image.
FOUND a real crash: thin image + small max_dim → cv2.resize(0).
Fixed max(1,int()); reproved 9,000 cases incl. max_dim=1. New invariant.

#3 Per-part look-alike

jobcard_flag_lookalikes marks parts that are look-alike variants;
Δ + /partdiff compare link in the builder + PDF. Agrees with the cover warning (silent on format-drift).

#4 Drag-drop ingest

/ingest drop-zone + folder detect (webkitGetAsEntry) + Recent paths.
Honest to the server-path model — no upload subsystem, corpus stays read-only (R1/R6).

#5 Accessibility (WCAG AA)

:focus-visible everywhere (base.css).
Palette: listbox/option ARIA, aria-activedescendant, focus return, keyboard-operable pill. aria-hidden on decorative icons.

CONGRUENCY — do the pieces mesh? (test_congruency.py)

- Every cross-link a feature emits must resolve to a route the app actually serves — no dangling references as features multiply.
- figureparts → /dossier, /locate · jobcard part rows → /partdiff, /dossier · palette's 22 destinations → real routes/pages.
- look-alike WARNING (cover) and per-part FLAG use the same 'real difference' gate — verified they agree (and both stay silent on format-drift).
- VERIFIED in-sandbox: figureparts links all resolve; all 22 palette destinations resolve; 0 dangling. (full check runs host-side.)

R9 — NO-TRUNCATION GATE (new standing rule, this project only)

The sandbox mount truncates / stale-caches / null-pads grown host files, so 'it parsed in the sandbox' is unreliable here. R9: always verify completeness mechanically — a tail sentinel on every generated file + verify completeness run HOST-side (bundled into engine/tools/notrunc/ and VERIFY-099.bat) where the files are whole, or via the host-authoritative Read tool. This session that discipline caught the '# -- END --' false-tail and confirmed the real files are complete.

R1 · all additive: 1 one-line crash fix + 4 feature melds + 1 congruency test + the R9 gate. Nothing writes the index. Read-only, rollbackable.
