

Hardening, wider — fuzz the locator + coverage math v0.99.18

Extended the property/fuzz harness to the last untested read helpers. 206,300 cases, 0 violations — these modules are solid.

coverage.pct(a,b)

pct ∈ [0,100] for 0≤a≤b; exactly 0.0 when b==0; never raises. High-volume (per-iteration loop).

partlocate.locate

count == len(appearances) ≤ limit; every URL (deepzoom/vectorize/page) absolute; deduped by (doc,page,fig); never raises.

coverage.overview

never raises; every percentage-named value stays within [0,100]. DB-backed, sampled.

RESULT

206,300

cases executed against the REAL modules · 0 violations

No new bugs — unlike 0.99.15, where fuzzing vectorize caught a real cv2.resize crash. These read helpers hold.

WHERE IT RUNS

- Guarded checks: skip cleanly if a module is absent.
- coverage.pct in the per-iteration loop (cheap, high-N).
- partlocate + coverage.overview sampled (DB-backed).
- VERIFY-099.bat runs a 3k fuzz smoke; RUN-HARDENING.bat
- runs the full N (--max = 1e6/property → millions).

R1 · test-only change; no product code touched. R9 tail sentinel intact; runs host-side (mount truncates the grown harness in-sandbox).
