

Quality & ops — analytics · HTTP fuzz · mutation · installer v0.99.24/30/31/32

▣ Usage analytics

analytics.py — append-only local JSONL, OFFLINE, no accounts.
/api/analytics_top + palette beacon.
hot_docs() → prioritize OCR on the docs people actually use. Self-test green.

▣ HTTP integ/fuzz

test_http.py + RUN-HTTP-FUZZ.bat.
Spins the real app on a test port, hits EVERY GET route (adversarial params), asserts no 5xx + /api JSON. Real request-path coverage.

▣ Mutation testing

RUN-MUTATION.bat extended to figureparts / jobcard (test_jobcard) + coverage (property fuzz).
Survivors = test blind-spots — a true test-quality metric for v1.0.

▣ Installer

viewer.spec + BUILD-INSTALLER.bat → dist\THE_VIEWER.exe (no Python).
FIRST-RUN.bat points at corpus, re-tunes hardware, runs doctor, launches. For shop-floor PCs.

VERIFIED / R1

- analytics.py self-test green in-sandbox (ranking / counts / hot-docs / kind-coercion / empty-drop).
- HTTP fuzz + mutation are host-side runners (need the app / mutmut-style loop); harness logic written + wired into batch files.
- Installer + FIRST-RUN are host build/run scripts; spec lists all hidden-imports so the frozen exe finds the feature modules.
- All additive: new modules + scripts, no product-code regressions. analytics is append-only sidecar (R1/R6).
