

Structured-table extraction — jump straight to the spec numbers v1.1.1

Worked example — a spec table becomes queryable numbers

ITEM	DIMENSION	UNIT
Overall length	180	in
Curb weight	5200	lb

→ flagged SPEC · units {length, weight}

Why it matters: dimensional data in TMs lives in leading-particulars / specification tables that OCR flattens unstructured text. Recovering the table structure — and flagging the ones that carry units — lets a mechan directly on the numbers instead of reading prose. Pairs with /measures.
