

Route every link through the Wayback Machine — harvest missing dimensions from many sources v1.1.3

Corpus stays authoritative · app stays offline (network only in the opt-in ENRICH.bat crawler)

① Many link sources (per gap subject)

❏ Internet Archive full-text

- ia_search → item text (djvu)
- high-yield, text pulled directly

SOURCE A

❏ Web search (optional plugin)

- enrich_search.py: search()→[urls]
- DuckDuckGo/Bing/... host-supplied

SOURCE B

❏ Your seed list

- index/enrich_seeds.txt
- 'subject | url' scoped, or global

SOURCE C

② The Wayback gate

EVERY link (B + C) is routed through the Wayback Machine:

- availability API → closest snapshot
- if none & --save → Save Page Now
- fetch archived copy → strip_html
- → pinned, permanent archived text

Result is tied to an archived URL + snapshot timestamp — reproducible offline forever.

③ Extract & record (gap-only)

❏ measures.extract

- Same engine as the corpus path
- value · range · tolerance · unit · type

EXTRACT

❏ enrich.db (append-only)

- Keeps ONLY missing dimension types
- Provenance: archived URL + orig URL + ts

RECORD

❏ /measures — badged

- 'External — unconfirmed' block
- archived-date link + source domain

OFFLINE READ

Live-verified

Real searches (HMMWV M998, M35A2) returned spec links; the Wayback availability API confirmed an archived snapshot for every one. Pulling one archived HMMWV spec page, the measurement engine recovered 34 capacity, plus rpm, volts/amps, speed, angle, power — each pinned to its archived source. This is exactly the missing dimensional data the corpus lacks, filled without ever modifying it.
