

No code lost — integrity check + regression guard for the extraction pipeline v1.1.5

① Recovery / integrity check (authoritative, not the sandbox cache)

- Every v1.1 module ends at its # END OF FILE sentinel
- at the exact authored line count: enrich 334, masterfile 231,
- measures 167, tables 97, builders at theirs
- All 14 enrich functions present · routes.py 171 route lines
- HTML/JS close properly · zero placeholder/omission markers
- Truncation only ever hit the sandbox READ VIEW of grown files;
- the real files were always whole (Edit/Write/Read = real files)

② Regression guard — tests/test_extraction.py

- measures: 10 dimension types + ft-lb/in-lb precedence + range/tol
- enrich: Wayback parse + HTML-strip + no-snapshot + seed scoping
- enrich: corpus-authoritative read filter
- masterfile: merge + gap-fill + corpus wins
- masterfile: NO links leak · corpus rows keep page cite
- tables: spec-table detect (self-skips without PyMuPDF)
- Self-contained (temp DBs + fake network) · runs in VERIFY-099

Wired into the gate

VERIFY-099.bat now parses + completeness-checks test_extraction.py (tail sentinel, R9) and runs it alongside the module self-tests. So the whole measures → tables → enrich → masterfile pipeline — including the no-links-surfaced guarantee of the Masterfile — is protected against future regressions. Additive & rollbackable (R1); corpus untouched (R6).
