

# Read routes degrade gracefully on un-built sidecars v1.3.4

One error boundary, now classifying DB errors instead of blanket-500

## GET /api/\* raises ...

registry.ParamError (bad ?limit=abc)

-> 400

FileNotFoundError (missing doc/page/crop)

-> 404

OperationalError "no such table" (sidecar NOT built)

-> 200 {ok:false, unavailable:true}

OperationalError "no such column" / locked / corrupt

-> 500 + log ref (real DB issue)

KeyError / TypeError / any logic bug

-> 500 + log ref (stays visible)

## Why

THE VIEWER now has many OPTIONAL sidecars (measures/tables/enrich/masterfile/kg/sides/chapters). A route hitting one that hasn't been built should say 'not built yet', not crash with a 500. This fixes the real flags, WITHOUT hiding genuine bugs (those still 500 with a log ref). The originally-reported 500 list was from stale 0.99.34 code -- re-run RUN-HTTP-FUZZ.bat for a current signal.
