

Duplicate route collisions fixed + audit guard v1.3.5

A {path:handler} registry silently drops one of two same-path handlers

Before — collision (one handler DEAD)

```
@get /figcrop (doc/page crop) <- deepzoom/rpstl/xref
```

```
@get /figcrop (name crop) <- visual search ← wins
```

=> doc/page figure crops 404 all over the app

```
@get /api/coverage overview <- /coverage,/ops
```

```
@get /api/coverage per-vehicle <- home ← wins
```

After — merged, branch on param

```
/figcrop: ?name= -> figcache file
```

```
else -> doc/page crop
```

```
/api/coverage: ?vehicle= -> per-vehicle
```

```
else -> overview
```

both callers work; no dead handler

Guard so it can't recur

audit_features.py [0] now scans the routes source for repeated @get/@post on the same (method, path) and FAILs on any duplicate -- the runtime dict hid these. GET+POST on one path (legit read/write) is not a same-method duplicate. Runs in VERIFY-099. Pairs with v1.3.4 (read routes degrade instead of 500 when a sidecar isn't built).
