

Self-learning search + a calmer modal — proposal

Surface what you already log. Decide before we build. (Fault is already mandatory — no change needed there.)

THE LEARNING LOOP · no new plumbing — request_items already captures every end-to-end success

SEARCH FIELD · fewer examples, one that rotates

BEFORE — 4 static examples (busy):

What do you need? e.g. gasket · 5330-01-186-9023 · 2202 ...

AFTER — one real example, rotates each open:

ALTERNATOR, DUAL VOLTAGE · 2920-01-449-2202

Cold start (new install):

a small curated seed list (battery, gasket, alternator, fuel filter w/ real NSNs) shows first, then quietly shifts to YOUR common parts as they log.

RECOMMENDATIONS

1 · Learn from successful sheets

Aggregate request_items (your end-to-end log) by NSN + nomenclature, weighted by frequency and recency. No migration.

2 · Rotating example, not a list

Show ONE clean example in the field; pick a random common item each open. Calmer, and it teaches by showing real format.

3 · 'Commonly requested' quick-picks

A thin row of 4-5 learned chips on Home / under search — tap to search. Subtle, not hand-holding.

4 · Predictive stays as-is, ranked

Keep live FTS typeahead; just boost learned-popular hits to the top. No intrusive dropdown.

5 · Trim the copy

Shorter modal subtitle + one-line hint. Let the rotating example do the explaining.

6 · Optional: also learn searches

Add an opt-in search log later for broader signal (noisier). Start with high-signal successful sheets only.
