

Structured parts index — built (Phase 1)

v0.19.0 · RPSTL → cited NSN↔figure index · /api/part + /api/coverage · catalog refs in the cart · multi-sheet PDF · suggestion capture. Additive (migration 0004).

EXTRACT (offline, idempotent)

viewer_ingest.py parts
scans RPSTL pages ('Usable On Code')

↓

parts table (migration 0004): NSN · FIG# · figure
title · doc · page · vehicle — cited.

Auto-refreshes after run / ocrall.

QUICK WINS

Multi-sheet 104th
>6 items now paginate across sheets ('Sheet 2 of 2') instead of capping at 6.

Capture suggestion
sessions store the suggested tech status + basis next to the confirmed one — sharper learning.

GROUNDLED — AND HONEST ABOUT THE LIMIT
What's reliable and shipped: the NSN→figure→page→vehicle citation index (every record points at a real page you can open and verify). The cart auto-fills only the FIG number from the catalog and shows the cited figure title; it never fabricates a part number or nomenclature.

Deliberately deferred: exact NSN↔part#↔nomenclature row alignment and automatic look-alike-variant warnings. OCR de-interleaves RPSTL columns, so asserting those now risks putting a wrong part on a request sheet. That precise table parser is the Phase-2 follow-up, strengthened by the ongoing OCR pass.

PROVEN ON YOUR INDEX

RPSTL pages parsed3,748

NSN records28,330

distinct NSNs10,521

(sample index; grows with the full corpus + OCR)

OUTPUTS

Cart: cited catalog ref + FIG auto-fill
' In parts catalog: FIG 3 Cooling System (p.372) — verify' · click opens the page

Vehicle hub: '% searchable' coverage badge
GET /api/coverage — Buffalo 99% · M998 97% · gens 91%

GET /api/part?nsn= → cross-references
same NSN across figures, each cited
