

Where authoritative military NSN data comes from — assessment

You asked to assess fuller sources before pulling. Verdict: PUB LOG (DLA) — free, monthly, no CAC, public-domain — and it carries the exact fields we were missing.

PUB LOG® (DLA) Publicly-releasable FLIS catalog: NSN→item name, Characteristics (CHAR), Master Cross-Reference (NSN↔part#↔CAGE), Interchangeability/Substitutability + AAC, item-name directory. Single .ZIP, updated monthly, free, no CAC. Authoritative · current · comprehensive · public-domain USE THIS	WHAT PUB LOG FILLS HERE NSN → nomenclature the parts-request sheet item names NSN ↔ PART # + CAGE (MCRD) the exact part# OCR couldn't pin down — Phase-2 gap, solved by data Characteristics (CHAR) size / thread / material → the SIZE parameter for Tier 2.5 parametric 3D AAC (acquisition advice) fills the 104th's AAC FEDLOG block Interchangeability / Substitutability real substitute parts → grounds look-alike / variant warnings
WebFLIS® (DLA) Per-NSN web lookup (name, part numbers, suppliers). Interactive, not bulk — good for verifying one NSN. official · not a bulk fill spot checks	
GSA NSN Extract (data.gov) Public/CC0, but the GSA-Advantage commercial subset, last updated 2017. PUB LOG covers it and far more. public-domain but partial & dated superseded	
FED LOG® (DLA) Fuller product incl. management/pricing — but access-controlled; not the public path. not publicly downloadable restricted	
Commercial mirrors (nsnlookup, ISO, etc.) Scrape FLIS; unofficial, variable quality. Excluded by your 'official-only' choice. unofficial avoid	
ONE-TIME, OFFLINE-PRESERVING PROCEDURE On a CONNECTED machine: download PublogDVD.zip (free, no CAC) from DLA → extract. Use PUB LOG's built-in Search Batch / SQL export to dump records for your NSN list to CSV (NSN, item name, part#, CAGE, characteristics, AAC). Run `enrich` against that CSV → fills the offline reference tables (append-only, cited, R6). Copy the DB back. Engine never goes online. Caveats: the .ZIP is large (~GB); data is in the IMD product format, so the Batch/SQL export step is how you get clean CSV. Restricted/proprietary/NATO data is excluded (fine for us).	
BONUS — this also unblocks earlier gaps PUB LOG's MCRD gives the authoritative NSN↔part# we deferred in the structured-parts work (it was OCR-noisy), CHAR gives the Tier 2.5 size parameter we said we'd need, and MDI&S gives real substitutes for look-alike warnings + the AAC field. One public, free, monthly dataset closes several gaps at once — additively (R6).
