

BUILT — System Status · auto-snapshots · OCR finishing · suggestions (v0.31.0)

A one-glance health page, automatic daily backups, a resumable OCR finisher, and three recall/curation features — all additive.

1 · SYSTEM STATUS PAGE (/status · /api/status)

Documents
39,683

Pages
1,848,465

Parts
227,908

NSNs
41,701

Searchable coverage

93.5%

OCR progress

1.6% (118,964 pending)

Data protection

last snapshot · vault count

Correlations

19,511 interchange · 884 drift

NIIN-drift review queue (FSC-conflict flagged) + Fault→parts lookup
Fast: indexed counts only — no slow full-table scans on the 3.6 GB index.
Read-only dashboard; opens at <http://127.0.0.1:8765/status>

2 · AUTOMATIC SNAPSHOTS

Daily Windows task
register_snapshot_task.bat

→

safeguard snapshot+verify
06:00 daily

Plus: snapshot BEFORE every data-mutating run

- run_ocr_gpu.bat --label pre-ocr
- run_enrich.bat --label pre-enrich

Runs natively on Windows so it reads the real, intact files. Snapshots are additive (R6); the main index is never modified (R1). Pre-op snapshots give a restore point; enrichment also has its own rollback.

Manual any time: `run_safeguard.bat snapshot | verify | recover /all`.

3 · OCR FINISHING (resumable, on your GPU)

prioritize
parts catalogs first

→

ocr batch
RapidOCR + CUDA

→

loop until pending=0
resumable

→

refresh parts index
auto

118,964 scanned pages remain (6.5%). 'ocrall' already finishes them across resumable batches; a snapshot is taken first and progress shows on the status page. The multi-day run executes on YOUR GPU — I made it bulletproof + trackable, I can't run it in this environment.

4 · SUGGESTIONS DEVELOPED

- Nomenclature normalization**
'BOLT, MACHINE'<->'machine bolt', gskt->gasket; widens recall (tested)
- Fault -> parts**
/api/faultparts: parts most requested for similar faults (your history)
- NIIN-drift review queue**
/api/niin_review: 884 groups, FSC-conflict flagged for review
- Scanner-friendly NSN**
USB barcode wedge types into search; camera-scan optional later

GROUNDING & INVARIANTS (R1 · R6)

All additive and reversible: new read-only endpoints + a status page + Windows automation; no change to the dataset, FTS search, or 104th sheet. Nomenclature widening only ADDS results when a query is sparse. Honest gaps: tool-list roll-up needs structured 'tools' data (the procedures table is empty) so it's deferred; fault->parts grows as requests are logged; OCR completion is GPU-time on your machine.

NEW ENDPOINTS / FILES

- | | | | | | |
|------------------------------|-----------------------|----------------------------|-----------------------------|-------------------|-------------------------------|
| • /api/status + /status | fast health dashboard | • /api/niin_review | drift queue (sidecar) | • /api/faultparts | predictive parts from history |
| • register_snapshot_task.bat | daily Windows backup | • normalize_nomenclature() | recall widening (in search) | • snapshot hooks | pre-ocr / pre-enrich |
