

BUILT — NSN alias map in search + GPU readiness (v0.33.0)

Confirmed-interchangeable NSNs now find each other in search; a one-command GPU check + a prioritized OCR queue make the OCR run fast and useful.

1 · CONFIRMED-INTERCHANGEABLE ALIAS MAP (grounded)

Example: search 5303-01-674-1467 → also surfaces pages/cover that wrote it as 5305-01-674-1467 (the confirmed-same bolt).

Grounded & reversible: aliases come ONLY from decisions YOU confirmed as 'interchangeable' — never auto-merged. No decision = no expansion (search is unchanged). Change your mind and the latest decision wins; delete reviews.db to undo entirely. The main index is never modified (R1/R6).

Tested: nsn_aliases expands only confirmed NIINs; sparse-query unaffected; alias search surfaces the equivalent NSN's pages (23/23 pillar tests).

2 · GPU READINESS + PRIORITIZED OCR QUEUE

python engine\gpu_check.py → one clear verdict

GPU READY ✓ (CUDAExecutionProvider)

CPU ONLY + exact fix
(driver / onnxruntime-gpu / CUDA match)

OCR queue — prioritized (parts catalogs first):

0 parts catalogs (RPSTL/24P)	25,516 pages
1 troubleshooting	373 pages
2 maintenance (-20/-24)	26,504 pages
3 operator (-10)	7,606 pages
5 everything else	59,240 pages

A partial run already helps: the pages mechanics search most (parts catalogs) are OCR'd first. Watch live progress on /status; stop and re-run anytime. OCR only ADDS text (R6).

Status: 1.6% done · 93.5% of all pages already searchable · 275 stuck pages recovered. The run itself is GPU time on your box (resumable).
