

BUILT — Page zoom: slider + scroll-to-cursor (v0.35.0)

Slide the schematic closer, or hover a spot and scroll to zoom in/out toward it — smooth and instant, composed into the same transform as tilt/mirror.

1 · TWO WAYS TO ZOOM

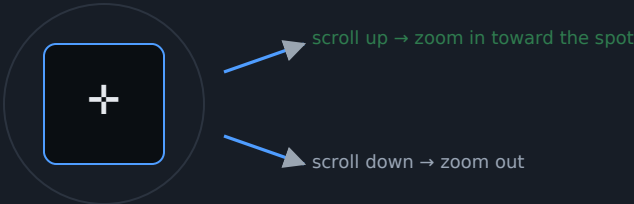

A · Zoom slider (like tilt X/Y)

100% ————— 400%, continuous

Drag to scale the page about its centre. The % readout combines the render DPI and the slider so it always reads true.

B · Hover + scroll (loupe OFF)

Zooms toward the point under the cursor (transform-origin follows the pointer). Double-click resets to fit. When the loupe is ON, the wheel drives the loupe instead — no conflict.

2 · ONE TRANSFORM PIPELINE

Zoom is one more term in the viewer's CSS transform, so it stacks cleanly with tilt and mirror and stays GPU-smooth. Resets per page. The stage scrolls (overflow:auto) so you can pan a zoomed page; HD + the loupe keep fine detail crisp.

Presentation-only & reversible (R1/R6): the page data, index, search and 104th sheet are untouched.
