

PROPOSAL — Retroactive post-support: comparable responsiveness on legacy Windows

Responsiveness != horsepower. Do the heavy work ONCE on the fast PC; the legacy box serves a finished artifact and does only light work. Daily use feels just as snappy.

1 · THE KEY MOVE — split heavy (once) from light (every day)

2 · COMPATIBILITY-BASED ENHANCEMENTS (help the old PC without slowing it)

3 · TWO MODES (auto-picked by the probe, manually overridable)

EXPECTED FEEL (everyday tasks)		
Task	Modern RTX	Legacy + this plan
Search (FTS)	~50 ms	~120-200 ms (still instant)
Open a page	~100 ms	~120 ms from cache (vs ~600 ms live)
Type-ahead / browse	instant	instant (stdlib + SQLite)
