

BUILT — How to do it: the procedure view (v0.47.0)

Closes the mission's 'complete instructional rundown' gap: find a part, then see HOW to remove/install it — steps, tools, and the WARNINGS — each cited to the real page.

1 · FROM A PART NAME TO THE STEPS (/procedure · /api/procedure)

2 · WHAT IT EXTRACTS FROM EACH PAGE

- **Section kind** Removal / Installation / Disassembly / Assembly / Replacement / Adjustment / Repair / Service / Inspection / Cleaning — from a standalone heading (not 'ENGINE ASSEMBLY').
- **Numbered steps** lines like '1. Disconnect...' '2. Drain...' captured in order, in full.
- **Tools required** the 'TOOLS REQUIRED / Special Tools / TMDE' block — listed as chips so you can stage them before starting.
- **Cautions** WARNING / CAUTION / NOTE / DANGER callouts pulled out and colour-coded so safety text can't be missed.

GROUNDED, AND HONEST ABOUT IT (R1/R6)

The procedures table shipped empty, so this parses the procedure straight from the manual page TEXT at query time — read-only, nothing invented or written back. Every card links to the real cited page and the UI says 'verify torque, sequences and cautions on the actual sheet'. It's a fast on-ramp to the page, not a replacement for it. Coverage grows as OCR makes more scanned procedure pages searchable. Parser verified on a representative work-package page: kind=Removal, 3 steps, tools + WARNING/CAUTION/NOTE all captured; the FTS query mirrors the proven search() path.
