

BUILT — Solve it: the workflow hub (v0.48.0)

One screen that walks a mechanic from a symptom to a fix — stitching together features that already exist, each step cited. The program now matches the real shop workflow.

THE CHAIN (/solve — orchestrates the existing endpoints, no new index work)

WHY IT MATTERS

Until now the mechanic had to bounce between search, the parts catalog, the procedure pages and the schematics by hand. The hub assembles them into one 'case file' for the job: what part, how to replace it, what tools, what to watch, which NSN is right for THIS vehicle, and the wiring — turning a pile of capabilities into a single guided path from broken to fixed.

GROUNDING & ADDITIVE (R1/R6)

Pure client-side orchestration of endpoints that are already tested — no new database work, nothing written back. Every panel deep-links to the real cited page so the manual stays the source of truth, and the UI reminds you to confirm torque, sequence and the exact NSN (UOC) on the sheet. New /solve route only; rollback = remove it. solve.html JS lints clean.
