

BUILT — Type-ahead predictive search (v0.49.0)

Google-style suggestions as you type — but fully offline, so it's instant. Strengthens the core 'predictive search' goal.

1 · WHERE THE SUGGESTIONS COME FROM (/api/suggest — prefix, ranked)

Vehicles

distinct vehicle names (cached 5 min) — jump straight to a platform

Parts

item names previously requested (your own catalog of real parts)

Manual words

real terms from the pages via the FTS vocab table, ranked by frequency — typo-free, on-topic

Ranked vehicles → parts → words; deduped; 8 shown. All from indexed columns / the FTS vocab — no scan, no network. Debounced 120 ms; ↑/↓ to choose, Enter to search.

2 · IN THE SEARCH BOX

alt

▢ ALTERNATOR ASSEMBLY

PART

▢ alternator

TERM

▢ M1083 ALT...

VEHICLE

Selecting a suggestion fills the box and runs the search. The dropdown closes on Escape, blur, or an outside click; keyboard-navigable and screen-reader labelled (role=combobox/listbox).

GROUNDING & ADDITIVE (R1/R6)

Read-only over existing indexes (vocab + vehicles + request history) — nothing written, no scan. Verified on a synthetic FTS5 vocab DB: 'alt'→ALTERNATOR/alternator, 'hmmwv'→vehicle, ranking vehicles>parts>words. New /api/suggest route only; rollback = remove it + the dropdown. JS lints clean.
