

BUILT — UX consolidation (v0.55.0)

Four small additions that make the depth feel SIMPLE, not sprawling — and one integration instead of a new page. All ES5-safe + rps.js (true parallel compatibility).

📄 Visual steps (/stepflow)

- The parsed procedure as a big follow-along FLOW: numbered nodes + connectors, WARNINGS/CAUTIONs as colour-coded banners, tools staged at the top.
- The 'simple' visual for junior mechanics (the detailed list stays the 'advanced' view). Client-side from /api/procedure; print-friendly.
- Serves mission goal D (dynamic graphics for all levels).

Read-only; built from existing data (R1/R6).

⚙️ Torque specs — integrated, not a new page

- torque_specs() parses stated torque values (ft-lb / in-lb / N·m, incl. ranges) from the procedure pages, each cited.
- Surfaced as a PANEL inside the existing Part dossier — integration over sprawl, the opposite of a new standalone tab.
- Regex validated on 5 phrasings; /api/torque endpoint.

Restraint by design: fold into what exists (R1/R6).

⌨️ Command palette (Ctrl+K, everywhere)

- Press Ctrl+K on ANY page → one launcher to jump to any feature, or look up a part/vehicle via /api/suggest. Arrow keys + Enter.
- Loaded once by rps.js (already universal) — so it's global with a single include, no per-page edits.
- Tames the ~14-feature nav into one keystroke.

ES5-safe; self-contained; works on legacy via polyfills.

📖 Help & guide (/help)

- A 'what do you want to do?' map of every feature, grouped by the workshop workflow, plus a 30-second first-run tour.
- Makes the depth discoverable; the home nav now keeps the essentials and points to Ctrl+K / Help for the rest.
- Mostly static; honest 'the manual is the source of truth' footer.

The antidote to 'overbuilt' — discoverability, not more features.

COHERENT & COMPATIBLE (the point of this version)

This wave adds NO new heavy machinery — it consolidates. Every page this session is ES5-safe and carries rps.js, so the whole core workflow runs identically on modern, lite and legacy (down to IE11 via polyfills); only the rich-graphics pages (3-D / Circuit Lab / schematic tilt) stay modern-by-design. No full scans, keep-alive + gzip + page cache keep it fast. 44/44 tests green. Architecture stays modular & additive — every feature is one removable route.
