

BUILT — inline part tagging (background pencil) (v0.69.0)

Tagging lives in the background while you browse, not as a foreground feature page — a small pencil on every part, click to add your words.

A quiet pencil on every part

- tagger.js drops a small, low-key pencil on each part — NSN-bearing search results and every 3D library card (dossier / Look-Alike next).
- Click it: a tiny popover to add/remove your own words (slang, common names, tags) for THAT part.
- ES5-safe, dependency-free, served at /tagger.js.

Tag the part in front of you, in place.

Tags teach search

- A tag is stored against the part (by NSN, else name) in keywords_user.json and folded into the offline search expansion, live.
- So a word you tag onto a part also FINDS that part — and tags on the same part find each other.
- Directly teaches; indirectly improves every later search.

Your word now finds the part.

Background, not foreground

- Removed the prominent Keywords nav button; the manager page stays only as a quiet 'manage all' link inside the popover.
- The system stays out of the way until you reach for the pencil.
- All parts taggable, no dedicated feature field.

Out of the way until you want it.

VERIFIED

tagger.js syntax-clean + ES5-clean (RPS gate covers it). Tag logic isolation-tested: tagging NSN 6140-01-485-1472 ('battery, storage') with 'juice box' makes 'juice box' find the NSN AND the name; tags become mutually findable. Server functions + /api/tags + /tagger.js routes confirmed on host. Tags live-reload into search with no restart.
