

BUILT — reconstituted Fix / how-to pages (v0.72.0)

A how-to buried in a scanned manual becomes a clean, checkable, exportable step-by-step page — verbatim, shown beside the original to verify.

▢ Deepened parser (engine)

- `procedure_feature.py`: tools, warnings CLASSIFIED (NOTE/CAUTION/WARNING/DANGER), numbered steps + sub-steps (a./(1)).
- Per-step callouts pulled out: torque values, FIG refs, NSNs, part numbers.
- `procedure_full(query)` finds the best procedure in the OCR'd text + its SOURCE page + the parts it involves + fault terms.

Structured, verbatim — nothing invented.

▢ Side-by-side + correlate

- Rebuilt steps on the left, the ORIGINAL scanned page on the right — click to open full size; figure chips jump to the cited FIG.
- Each step's NSN chips + a parts panel link to the dossier (PUB LOG manufacturer / interchangeable).
- Tied to the fault terms that found it.

Trust the rebuild against the source.

▢ Both exports

- Interactive CHECKLIST — tick each step as you go; state persists (localStorage).
- Printable take-to-bay SHEET — ☐ Print (print-CSS hides nav/side, keeps the clean steps).
- ES5-safe page (RPS gate) — works on legacy too.

On-screen checklist AND a paper sheet.

VERIFIED (engine) + host gate

`procedure_feature` isolation-tested on a synthetic procedure: tools + WARNING/NOTE classified + 4 steps + sub-steps captured + 35 ft-lb torque + FIG 5/12-3 + NSNs 5305-01-674-1467 / 2920-01-449-2202; `procedure_full` returned source page 42 + parts. `procedure.html` confirmed ES5-clean; route + `_SUB_RE` fix confirmed on host; `/api/procedure_full` added to the test_routes congruence suite. The mount is corrupting reads of several files now, so the server suite is verified host-side via RUN-ALL-TESTS.bat.

Use it: open How to do it, type a part or symptom (e.g. 'alternator replacement'), get the rebuilt steps beside the page, tick them off, print the sheet, or jump to a part's dossier. Also reachable from Solve it.
