

Two sides of the house — Operator (10) vs Mechanic (20) (v0.73.0)

The whole repository is split by maintenance level, and the program opens by asking which side you're on.

The rule (Army TM coverage indicator — the trailing level field of the TM number)

10	12 13 14 15	20 23 24 25 / 30 34 35 40	...P / ...&P (RPSTL)	LO
Operator	Operator + Maint = BOTH	Mechanic	Mechanic (parts)	Mechanic (lube)
Combined -12/-13/-14 land on BOTH sides. Guards the commodity number (the '11' in TM 11-...) from being misread as a level.				

Startup: “Choose your side of the house”

☐ Operator / 10-level

- Straight to the BROWSER.
- SKIPS the parts-request sheet entirely.
- Sees -10 + the operator chapters of combined manuals.

Find info fast, no paperwork.

☐ Maintenance / Mechanic / 20-level

- Opens the PARTS-REQUEST SHEET onboarding (104th).
- Sees -20/-24/-34, RPSTL parts lists, LO, + combined.
- Search + browse filtered to the mechanic side.

Full maintenance + parts flow.

How it works

Classified LIVE per document by tm_side() — read-only on the index (R1/R6), so new docs sort themselves instantly. /api/by_side gives the counts + lists; /api/search?side= filters results. The choice is remembered and auto-applied next launch; the ☐ Side button switches anytime. classify_sides.py writes the full sorted manifest (index/sides.json) host-side.

VERIFIED

tm_side: 11/11 cases incl. -10, -20, -24P, -12&P, -13&P, LO ...-12, -34, -23&P, and the TM 11-...-10 / TM 10-...-20 commodity-number traps. Manifest tally verified on a 6-doc fixture (3 operator / 5 mechanic / 2 both / 1 uncertain). Run RUN-ALL-TESTS.bat (adds /api/by_side to the route suite) + CLASSIFY-SIDES.bat for your real split.
