

CAD images for the representative 3-D library (v0.86.0)

Every part rendered to a shaded isometric CAD image — scaled to its FLIS dimensions — cached as a sidecar, served on demand.

Two ways to populate

MAKE-CAD.bat pre-renders the whole representative set (ref_nsn with FLIS dims + figure-bearing parts) with progress + ETA, resumable. Or skip it: /cadimg renders each part the first time it is viewed and caches it.

What a CAD image shows

A clean three-quarter shaded view of the part's shape, the overall bounding dimensions called out in inches, and a title block with the NSN, nomenclature and shape family. Labeled REPRESENTATIVE — not a manufacturing drawing.

Verified

Sample families rendered in isolation (bolt/gear/bearing/canister/bracket/switch) and end-to-end through the live server (/cadimg?nsn= -> valid PNG). Additive + legacy-safe: static PNGs need no WebGL, a real win for old machines.
