

Real part imagery — cited figure crops (v0.76.0)

Preview boxes + the 3D modal now show the manual's OWN illustration of the exact part — not a vague blob.

Pipeline (all offline, index never written)

What you see

Manual illustration (default)

- The cited exploded-view figure, cropped from the page.
- Public-domain US Army TM art — authoritative & exact.
- Shown in the preview box + the modal's first tab.

Accurate, legal, offline.

Representative 3D (kept)

- FLIS-dimension parametric mesh for primitive families.
- Clearly labeled 'representative — not a CAD model'.
- Interactive tab, paired with the real figure.

Truthful where it's accurate.

⚠ Approximation (opt-in)

- OFF by default; a checkbox enables it.
- Watermarked 'ARTISTIC APPROXIMATION — NOT TO SCALE'.
- Local image->3D model is a documented future hook.

Never authoritative.

Why not 'real CAD for every part'

Military NSN CAD + repair data is ITAR-controlled technical data — not freely downloadable/bundleable; web CAD is license-locked and rarely matches the exact NSN; AI 3D is an approximation, unsafe as authoritative in a maintenance tool. So we use the manual's own cited figure instead. Sources: pmddtc.state.gov, federalregister.gov.

VERIFIED

Region heuristic on a synthetic page: found 'Figure 5' caption, cropped top->caption (excludes the parts table). Full path on a fixture index: NSN -> cited figure (doc1/p.1/fig5) -> extracted+cached crop (18 KB PNG), cache hit on repeat, unknown NSN handled. Run EXTRACT-FIGURES.bat to prewarm the whole corpus; routes in RUN-ALL-TESTS.bat.
