

Part-number → breakdown image (BUILT) v0.78.0

Search a part number; get its exact item, FLIS-validated name, and the correlative breakdown image up top.

What was built (your four tiers)

🔍 T1 · RPSTL row parser

- item/SMR/NSN/CAGEC/PART#/nomen/qty, confidence-scored.
- Codes excluded from the name -> clean nomenclature.
- Variant grouping (-010 ↔ -010X). Sidecar rpstl.db.

Verified on your example.

🔍 T2 · FLIS validate

- NSN -> official INC name from PUB LOG (ref_nsn).
- Repairs OCR: 'HOSE NONMET' -> 'HOSE, NONMETALLIC'.
- 'WSHR' -> 'WASHER, LOCK'. CAGEC disambiguates makers.

Accuracy lever, verified.

🔍 T3 · Callout (gated)

- OCR the figure for the item-number balloon.
- Crop tight ONLY when found unambiguously.
- Else -> whole-figure fallback. Never a wrong crop.

Tight when sure, safe always.

🔍 T4 · Part-number-first UX

- Search a part# -> 'PART NUMBER MATCH' card with the
- breakdown image, name, NSN→dossier, item/CAGEC/FIG,
- 🔍 zoom-to-item / 🖼️ whole-figure toggle.

The image displays directly.

Review queue + override

Low-confidence rows get an inline 🐞 Fix this match (correct the name/NSN) -> append-only rpstl_override.json, which wins on the next search. GET /api/rpstl_review lists them. Nothing silently wrong.

Build it: BUILD-RPSTL.bat (host) → index/rpstl.db. Then search a part number.

BUILT diagram. Dark (R3). v0.78.0 · 2026-06-03 · rpstl_feature.py · build_rpstl.py · /api/part_by_number · /api/callout_crop. Additive (R1/R6).
